Gas cylinder achieves productivity gains

Air Liquide, Montreal, QC has introduced the Minitop compressed gas cylinder, a portable ready-to-use version of its industrial-sized Altop cylinder. Using the Minitop cylinder products substantial savings in many ways through its concept and design by giving workers more flexibility and mobility while reducing the risks of industrial accidents or injuries. Economical to use, Minitop is lightweight (only 10 kg), ergonomic, easy to handle, and safe. The Minitop features an integrated regulator-valve that indicates the amount of gas remaining at all times.

Minitop's features make handling much safer than conventional cylinders. Its solid tulip cap, which is made of highly resistant, non-corrosive composite materials, protects the cylinder's regulator valve at all times. The design of each component also includes exclusive safety features. For example, the head is narrower than the body, which makes it less vulnerable when dropped. It also has an on/off lever, which eliminates leaks and allows the gas to be shut off instantly.
